```

The invention relates to a DNA construct (I) a second (F2) expression cassette. F1 of the

comprising a first (F1) and DNA construct, in operable

Claim 8; Page

3; 25pp; English

Novel DNA construct useful for producing a corn plant that tolerates application of glyphosate herbicide, comprises two transgene expression

WPI; 2002-165871/22.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               linkage, has rice actin 1 (RA1) promoter, RA1 intron, chloroplast transit peptide gene (II), glyphosate tolerant 5-enol-pyruvylshikimate-3-phosphate synthase (EPSPS) gene (III), and transcriptional terminator (IV), and F2 has cauliflower mosaic virus 35S promoter, Hsp70 intron, (IV), (III) and (IV). Also included are two DNA sequences from corn plant PV-ZMGT32(nk603) of 498 or 1183bp, or prineers and probes derived from them (used to detect transgene junction points). The construct is useful for producing a corn plant that tolerates application of glyphosate herbicide by transforming a corn cell with, selecting the corn cell for tolerance to application of glyphosate, and growing the corn cell into a fertile corn plant. The present sequence is a transgene junction probe sequence consisting of corn genomic DNA and vector sequences

                                                                                             Query Match
                                                                                                                                                                            The invention relates to a DNA construct (I) comprising a first (F1) and a second (F2) expression cassette. F1 of the DNA construct, in operable linkage, has rice actin 1 (RA1) promoter, RA1 intron, chloroplast transit peptide gene (III, glyphosate tolerant 5-enol-pyruvyishikimate-3-phosphate synthase (EPSPS) gene (III), and transcriptional terminator (IV), and F2 has cauliflower mosaic virus 35S promoter, Hsp70 intron, (III) and (IV). Also included are two DNA sequences from corn plant Pv-ZMG732(nk603) of 498 or 1183bp, or primers and probes derived from them (used to detect transgene junction points). The construct is useful for producing a corn plant that tolerates application of glyphosate herbicide by transforming a corn cell with, selecting the corn cell into a fertile corn plant. The present sequence is the 498bp amplicon consisting of corn genomic sequence, vector sequences and Rice ACT1 promoter
                                                                                                                              Sequence 498
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                application of glyphosate herbicide, comprises two transgene expression
                                                                                                                                                                sequences

species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprisobtaining a restriction fragment length polymorphism analysis produced the method comprisobtaining a restriction fragment length polymorphism. The present sequence for Mycobacterium fortuitum rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial

The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 pCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                     Bett AJ, ...

The present invention describes a method for propagating a replication-defective adenovirus in an adenovirus E1-complementing cell line expressing E1 gene product(s) which are non-native to the adenovirus, comprising providing all or a portion of an E4 region in cis within the genome of the replication-defective adenovirus. Also described: (1) a replication-defective adenovirus. Also described: of a replication-defective adenovirus all or a portion of a heterologous E4 region comprising a heterologous adenoviral ORF6, or the

, or that

The invention relates to a novel recombinant adenoviral vector of serotype 24 which is partially deleted in E1 and devoid of E1 activity and comprises a heterologous nucleic acid or an human immunodeficiency virus (HIV)-1 gene. A vector of the invention has anti-HIV activity, ar may have a use in gene therapy, and as a vaccine. The recombinant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Crecombinant, replication-defective adenovirus particles; (5) a purified crecombinant, replication-defective adenovirus particles; (5) a purified crecombinant adenovirus particles accordance with the method in (4), (6) a composition comprising purified crecombinant adenovirus particles; (7) effecting the delivery and crecombinant adenovirus particles; (7) effecting the delivery and crecombinant adenovirus particles; (7) effecting the delivery and crecipitation of heterologous mucleic acid; and (8) generating a cellular-defective adenovirus than individual. The replication-defective adenovirus in an adenoviral E1-complementing cellular useful for propagating and rescuing multiple serotypes of creplication-defective adenovirus in an adenoviral E1-complementing cellular-mediated immune response against coll line and for generating a cellular-mediated immune response against considered therapy and vaccine efforts. The present sequence represents a wild-type adenovirus serotype 24 nucleotide sequence, which is used in the exemplification of the present invention.

CC this invention relates to a method of predicting (the progression of) a conficient of a compound by preparing a gene expression profile of a compound tissue or cell sample exposed to the compound and comparing the compound in a tissue or cell sample exposed to the compound, where confiderential gene expression compared to a control indicates a toxic differential gene expression compared to a control indicates a toxic consecution of) at least one toxic effect of a compound. The genes are conversion of) at least one toxic effect of a compound. The genes are conversion of) at least one toxic effect of a compound. The genes are conversion of) at least one toxic effect of a compound. The genes are conversed to the compound or test agent will induce various specific kidney pathologies, such as nephritis, confident will induce various specific kidney pathologies, such as nephritis, confident of the methods are useful for determining the similarity of a toxic response to one or more individual compounds and for confidential confidence of predicting or elucidating the potential cellular pathways influenced, confidence or modelling the toxic response of a test compound, for confidence or modelling the toxic response of a test compound, for that show promise as new drug targets and for screening known and newly that show promise as new drug targets and for screening known and newly that show promise as new drug targets and for screening known and newly the invention. (Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Predicting (the progression of) a toxic effect of a compound, for monitoring the progression of renal disease states, comprises preparing agene expression profile of a kidney tissue or cell sample exposed to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mendrick

The protein encoded gastric juice secretion and neurotransmitter release. The protein encoded by the gene is capable of receiving PGE and of activating GTP-binding protein. MP653 (AAQ46125) is identical to MP660 (AAQ46124) with the exception of a 89-bp deletion in the coding region of the C-terminal tail of the receptor. This deletion creates a new reading frame downstream from this junction. This results in a 30 amino acid C-terminal fragment of the receptor being replaced with a new 26-amino acid fragment in the C-terminal end of the MP653 (AAQ46125) receptor. (Updated on 25-MAR-2003 to correct PN field.)

The protein encoded by the gene is capable of receiving PGE and of activating GTP-binding protein. (Updated on 25-MAR-2003 to correct PN field.)

encoding the transporter are useful as probes, primers, in biological assays, for constructing recombinant vectors, host cells and transgenic animals, for expressing antigenic portions of the transporter protein, for designing ribozymes, for monitoring the effectiveness of modulating compounds on the expression or activity of the human transporter gene in clinical trials or in a treatment regimen, in disquestic assays for qualitative changes in human transporter nucleic acid that lead to pathology, for testing an individual for a genotype that while not necessarily causing a disease, nevertheless affects the treatment modality, as antisense constructs to control human transporter gene expression in cells, tissues and organisms, and for gene thorapy in patients containing cells that are aberrant in human transporter gene expression. A gene chip comprising a transporter nucleic acid is claimed, and is useful for conducting cell-based assays involving the human
                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of genomic DNA encoding a novel human transporter protein that is related to the voltage gated potassium channel transporter family, and which is expressed in the lung and foetal brain. The gene is located on chromosome 17. Nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated human transporter peptide useful for treating disorder characterized by absence of, in appropriate or unwanted expression of transporter protein, and as immunogens to raise antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 51855 BP; 7256 A; 17204 C; 19038
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of a number of proteins involved in the biosynthes of melithiazol. These are designated Mel B - Mel H and ORF 1- ORF 7. The sequences can be used in the production of melithiazol, which exhibits fungicidal activity. The present sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemplification of the protein sequence is a coding sequence shown in the exemple sequence is a coding sequence shown in the exemple sequence sequence is a coding sequence sequence sequence is a coding sequence shown in the exemple sequence sequenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecule termed mel genes encoding polypeptide synthase and non-ribosomal peptide synthetase that are involved in synthesis of melithiazol displaying enhanced fungicidal activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Melithiazol synthesis; polyketide synthase; fungicide; nonribosomal peptide synthetase; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Melithiazol biosynthetic gene cluster.

The invention relates to a method of determining susceptibility of an CC individual to joint space narrowing and/or osteophyte development and/or CC joint pain comprising identifying whether the individual has at least one CC polymorphism in a polynucleotide encoding at least one of the protein CC listed in the specification. The methods, composition and agent are CC useful for modulating the susceptibility of an individual to joint space CC narrowing and/or osteophyte development and/or joint pain that is CC associated with a disease, preferably osteoarthritis. The cell line and CC an individual having susceptibility to joint space narrowing and/or CC osteophyte development and/or joint space narrowing and/or CC osteophyte development and/or joint pain. This sequence corresponds to CC the polymucleotide encoding a protein listed in the specification. (Note: The sequence data for this patent did not form part of the printed CC specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a DNA construct (I) comprising a first (F1) and CC a second (F2) expression cassette. F1 of the DNA construct, in operable CC linkage, has rice actin 1 (RA1) promoter, RA1 intron, chloroplast transit peptide gene (II), glyphosate tolerant 5-enol-pyruvylshikimate-3-CC (IV), and F2 has cauliflower mosaic virus 35S promoter, Hsp70 intron, CC (IV), and F2 has cauliflower mosaic virus 35S promoter, Hsp70 intron, CC (II), (III) and (IV). Also included are two DNA sequences from corn plant PV-ZMGT32(nk603) of 498 or 1183bp, or primers and probes derived from CC them (used to detect transgene junction points). The construct is useful for producing a corn plant that tolerates application of glyphosate CC herbicide by transforming a corn cell with, selecting the corn cell for tolerance to application of glyphosate, and growing the corn cell into a fertile corn plant. The present sequence is the 1183bp amplicon consisting of the Agrobacteium transcriptional terminator sequence, vector sequences and corn sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                The patent discloses a method for selectively enhancing the phosphonate CC herbicide tolerance in recombinant corn, tobacco, wheat, cotton, canola CC and rice plants, by transforming the plants with an expression cassette. CI tomprises of a structural DNA sequence, that encodes an aminomethyl CC phosphonic acid (AMPA) acyltransferase or transacylase (AAT), capable of CN -acylation of AMPA. This sequence has an amino terminal chloroplast CC transit peptide (CTP), that targets AAT to the chloroplast. Co-expression CC along with AAT provides (GOX) gene, encoding glyphosate oxidoreductase, CC along with AAT provides the transformed plants with higher resistance to CC phosphonate herbicides. This method is useful for enhancing phosphonate CC and to prevent self-fertilisation and enhance hetero-fertilisation. The CC coprable promoter and 5' sequences like intron, linked to modified E. CC coli phno coding region, encoding P2A AMPA acyltransferase (AAT) enzyme CC and plant operable termination sequences

                    Crice EPSPS promoter, genomic DNA encoding a rice EPSPS chloroplast CC transit peptide, genomic DNA encoding a rice EPSPS chloroplast CC terminator. The glyphosate (AAC87189), and a transcriptional CC terminator. The glyphosate (EAC87189), and a transcriptional CC containing two amino acid substitutions relative to the corresponding CC wild-type region (AAB29792). The invention also encompasses plant genomic CC EPSPS sequences identified via screening with a rice EPSPS intronic CC engagence; vectors and host plant cells comprising a nucleic acid sequence of the invention; transgenic plants (and tissues and seeds thereof) CC comprising a nucleic acid sequence of the invention, optionally further CC rematode, stress or herbicide resistance protein; and methods of CC constructs of the invention are used to produce a wide variety of CC constructs of the invention are used to produce a wide variety of CC constructs of the invention are used to produce a wide variety of CC constructs of the invention are used to produce a wide variety of CC constructs of the invention are used to produce a wide variety of CC constructs of the invention are used to produce a wide variety of CC constructs of the invention are used to produce a wide variety of CC sugarbeet and canola, but also other field crops, fruits and vegetables, cc turf and forage grasses and nut-producing plants. The plants are optionally resistant to insects, fungi, viruses, bacteria, nematodes, stress, desication and/or other field crops, fruits and vegetables, the production of a herbicidal target for the high throughput in vitro CC enhancer element which may be used in the rice EPSPS expression cassette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rice EPSPS; 5-enolpyruvylshikimate phosphate glyphosate resistance; herbicide resistance; expression construct; enhancer element; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       09-MAR-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to rice 5-enolpyruvylshikimate phosphate syntham (EPSPS) genomic DNA (AAC87188). The invention also relates to an expression cassette comprising, in the 5'-3' direction, one or more transcriptional enhancer elements selected from AAC87190-C87196), the

                                                                                                                                                                                                                                                  Isolated synthase
                                                        The present invention relates to an Oryza sp. 5-enolpyruvylshikimate phosphate synthase (EPSPS) gene. Vectors containing the gene may be used to produce plant tissues and fertile whole plants which are substantially tolerant or substantially resistant to glyphosate herbicide and to produce a herbicidal target which is used for high throughput in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

The present invention relates to an invention that results in the expression of the endogenous nucleotide sequence in plant cell being increased. In this method the plant cell comprises a second expression cassette comprising a nucleic acid molecule, where the expression of the nucleic acid molecule of interest in the plant cell is decreased as compared to expression of the nucleic acid molecule of interest in a plant cell lacking the first expression cassette. The methods and compositions of the present invention are useful in molecular biology a transformation, in particular for reproducing and predictably manipulating gene expression in a plant cell. The present sequence is a nucleotide sequence of rice actin promoter.
                                                                                                                                                                                                                                       Disclosure; Page 106-107; 108pp; English.

The invention relates to a grass plant, which has been genetically modified to substantially inhibit generative propagation and carry herbicide resistance. The grass is useful for growth and/or propagation of grasses. The grass is used to play at least one sport (e.g. baseball, cricket, football, golf, rugby, soccer or tennis), or used at least in a portion of an athletic field, lawn or park. The grass is fed to animal (e.g. cattle, goat, horse or sheep) or used as an animal feedstuff. The present sequence represents the coding sequence of pVDH636 vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABK11039

A method of developmental switch from vegetative to generative growth. A method of making a grass involves transforming the grass with a nucleic acid which interferes with metabolism of gibberellic acid. A grass can be treated by applying a phytohormone to at least partially relieve or reverse a change of in plant characteristic resulting from genetic modification. The genetically modified grass is useful for growing and/or propagating grass in athletic fields (for sports such as baseball, cricket, football, golf, rugby, soccer and tennis), lawns, parks and other types of landscaping. The grass is also useful as a naimal feedstuff for cattle, goats, horses cand sheep, due to its increased vegetative growth, improved digestibility and/or nutritional value as animal feedstuff. This sequence represents plasmid by NDH636 DNA. This plasmid was used as transformation vector for production of transgoric grasses avarageing the landscaping thallans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                          RESULT 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antibody. The invention also relates to constructs plasmids and vectors of producing the immunoglobulins; transformed plant cells, calli, plant cissues and whole plants for producing the immunoglobulins; the immunoglobulins methods for producing the immunoglobulins. The immunoglobulins of the invention may be used to treat HSV infection or tumour angiogenesis. The invention may be used to treat HSV infection or tumour angiogenesis. The invention comprovides the advantages of antibody production in plants, such as large scale production, reduced costs, and elimination of pathogenic contaminants such as viruses and prions, with a simplified (i.e., non-plant-specific) glycosylation profile which reduces the risk that the immunoglobulin may not be functional in animals. The present sequence represents the plasmid pDAB3014, which may be used in the invention. The plasmid contains a phosphinothricin acyltransferase (PAT) gene under the control of a rice actin promoter, and a maize lipase 3'UTR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a plant host cell system comprising a mammalian UDP-N-acetylglucosamine; beta-D mannoside beta(1,4)-N-acetylglucosaminyltransferases (GnTIII) enzyme, a nucleic acid sequence encoding a mammalian GnTIII protein, or a vector comprising the GnTIII nucleic acid. The plant host system is useful in producing a desired glycoprotein or its functional fragment may be used for the production of a pharmaceutical composition. The present sequence represents the nucleotide sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New plant host cell system for producing a desired glycoprotein comprises a mammalian N-acetylglucosaminyltransferase (GnTIII) enzyme, a nucleic acid sequence encoding the enzyme, or a vector comprising the nucleic acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               misc_feature

elements essential for its functionality and transgenesis of a cell (especially a plant cell). The vector consists of at most one origin of replication (ori), at most one sequence encoding a selection agent and a trfA locus encoding a protein that increases the level of plasmid replication. The vector particularly contains an RK2 ori, especially oriv from pRK2 of Escherichia coli with a broad host range, an antibiotic resistance gene (especially nptiII conferring resistance to kanamycin in bacteria) and a trfA locus from pRK2 encoding the proteins P285 and P382. The vectors are used to prepare transgenic plants and transformed host cells for production of a heterologous proteins, e.g. insulin, interferon, lipase, blood proteins and anti-inflammatory agents. The present sequence represents a plasmid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SdC

The vector consists of at most one origin of replication (ori), at most one sequence encoding a selection agent and a trfA locus encoding a protein that increases the level of plasmid replication. The vector particularly contains an RK2 ori, especially oriving particularly contains an RK2 ori, especially oriving particularly contains an RK2 ori, especially oriving particularly not a broad host range, an antibiotic resistance gene (especially nptIII conferring resistance to kanamycin in bacteria) and a trfA locus from pRK2 encoding the proteins press and passes and passes of the vectors are used to prepare transgenic plants and transformed host cells for production of a heterologous proteins, e.g. insulin, interferon, lipase, blood proteins and anti-inflamatory agents.                                                                                                                                                                                                                                    The invention relates to a novel seed of the bentgrass plant designated ASR-368. Also disclosed is the method for controlling weeds in a turfgrass stand of bentgrass ASR-368. The plant or plant parts are useful for producing plants with improved agronomic traits, such as herbicide tolerance, particularly to glyphosate herbicide. It may be used as a turfgrass stand. Methods are disclosed that are used for detecting the transgene/genomic junction region in bentgrass plant ASR-368 or its progeny. The present sequence represents the ASR-368 3' transgene/genomic
                                                                                                                                                                                                  Sequence 474
                                                                                                                                                                                                                                                                                                                                                                            New bentgrass ASR-368 plant and seed useful for producing improved glyphosate herbicide tolerance or as a turfgrass

                                                                                                                                                                                                                                                                                                                                             The invention relates to insect resistant cotton plants, tissues and seeds that include the MON15985 event. The methods and compositions of the invention are useful in the field of plant molecular biology, in particular plant insect protection and plant breeding. The MON15985 event confers resistance to Lepidopteran insect damage. The present sequence is A. tumefaciens DNA used in the exemplification of the invention
